Key Highlights:

- Clay-hosted REE mineralisation has been confirmed in the previously untested tenement EL1766, with broad-spaced exploration holes extending REE mineralisation by a further 8 kilometres.
- Opportunistically-placed exploration drill holes in EL1766 returned REE intersections of:
 - RRMDD042: 4.4 metres @ 981 ppm TREO from 3.80 metres
 - RRMDD043: 3.5 metres @ 589 ppm TREO from 2.95 metres
 - RRMDD044: 2.0 metres @ 617 ppm TREO from 2.70 metres
 - RRMDD045: 7.2 metres @ 556 ppm TREO from 0.95 metres
 - RRMDD046: 5.5 metres @ 642 ppm TREO from 3.75 metres
- Remaining drill holes (RRMDD 035-041) from the Makuutu Central Zone all contained REE mineralisation with best intercepts of:
 - RRMDD037: 3.0 metres @ 1,066 ppm TREO from 3.10 metres
 - RRMDD041: 6.50 metres @ 1,385 ppm TREO from 4.70 metres
- Overall, 44 of the 46 holes drilled in the 2019 campaign intersected clay-hosted REE mineralisation within a 26 kilometre-long corridor through the project area.

Oro Verde Limited (“Oro Verde” or “the Company”) (ASX: OVL) is pleased to provide results from the final 12 diamond core drill holes (RRMDD 034 to RRMDD 046) of the 46-hole drilling program completed at the Makuutu Ionic Clay Rare Earth Elements (REE) project.

These data included results for 5 broad spaced exploration holes from the untested target areas of EL1766, located up to 8 kilometres east of the extents of previously demonstrated mineralisation.

Commenting on the completion of the drilling program and envisaged development pathway, Oro Verde Technical Director Dr Marc Steffens said:

"The company is excited to receive results confirming REE mineralisation in EL1766 where all exploration holes – which were placed opportunistically on sidings of existing access tracks – intercepted REE mineralisation with grades exceeding 500 ppm TREO. The company plans to define these newly identified mineralised zones with a focused drilling program in 2020. Additionally, the final results from drilling of the Makuutu Central Zone all demonstrated intercepts with grade exceeding 500 ppm TREO. Overall, 44 of the 46 drill holes completed in this program have returned TREO grades exceeding 500 ppm".

"With numerous areas of rare earth mineralisation having been identified over the large project area, a potential low-CAPEX project configuration under examination consists of several low-cost satellite processing (leaching/desorption) plants, from which an enriched liquor will be pumped to a central hub for production of a saleable, mixed rare earth product. Further studies into these concepts are in progress."

Project Overview

The Makuutu project, located in Uganda is significant in size and is understood to be potentially one of the largest ionic clay deposits outside of China. Drilling on the project to date totals 47 diamond core holes and 109 historic RAB holes, with the Company working toward validating its previously announced exploration target of (ASX: 4 September 2019):

270 - 530 million tonnes grading 0.04 – 0.1% (400 – 1,000 ppm) TREO*.

*This Exploration Target is conceptual in nature but is based on reasonable grounds and assumptions. There has been insufficient exploration to estimate a Mineral Resource and it is uncertain if further exploration will result in the estimation of a Mineral Resource

The Makuutu project contains ionic clay-hosted rare earth mineralisation, like those found in China which are the source of the majority of the world's heavy rare earths production, and very different to hard rock-hosted rare earths projects. Mineralisation at Makuutu occurs from surface to depths of 15-20 metres and mining will be simple. The processing of ionic clays is also simple where the clay undergoes a simple desorption process – akin to washing – in which rare earths are desorbed into a salt solution, concentrated and precipitated to create a mixed rare earth product. Tailings (the washed clay) are expected to be returned to the mined open pits and areas progressively rehabilitated. The process is expected to have a small environmental footprint while capital and operating costs are expected to be low.

The Company has acquired a 20% interest in the project and may acquire up to a further 40% interest via an "earn-in" process through the expenditure of funds, bringing its total potential interest in the project to 60%.

Key project highlights:

1. Ion Adsorption Clay deposits are currently the lowest cost sources of rare earths in the world
2. Special concentration of high demand rare earths - Terbium, Dysprosium, Praseodymium and Neodymium,
3. Simple and low-cost mining.

Drilling Program

The recently completed drilling program included 41 diamond core holes and 3 window sampler holes on the Makuutu Central Zone and 5 diamond core holes testing for REE mineralisation on the unexplored exploration licence EL1766. Figure 1 shows the locations of the recent drilling and the historic RAB drilling.

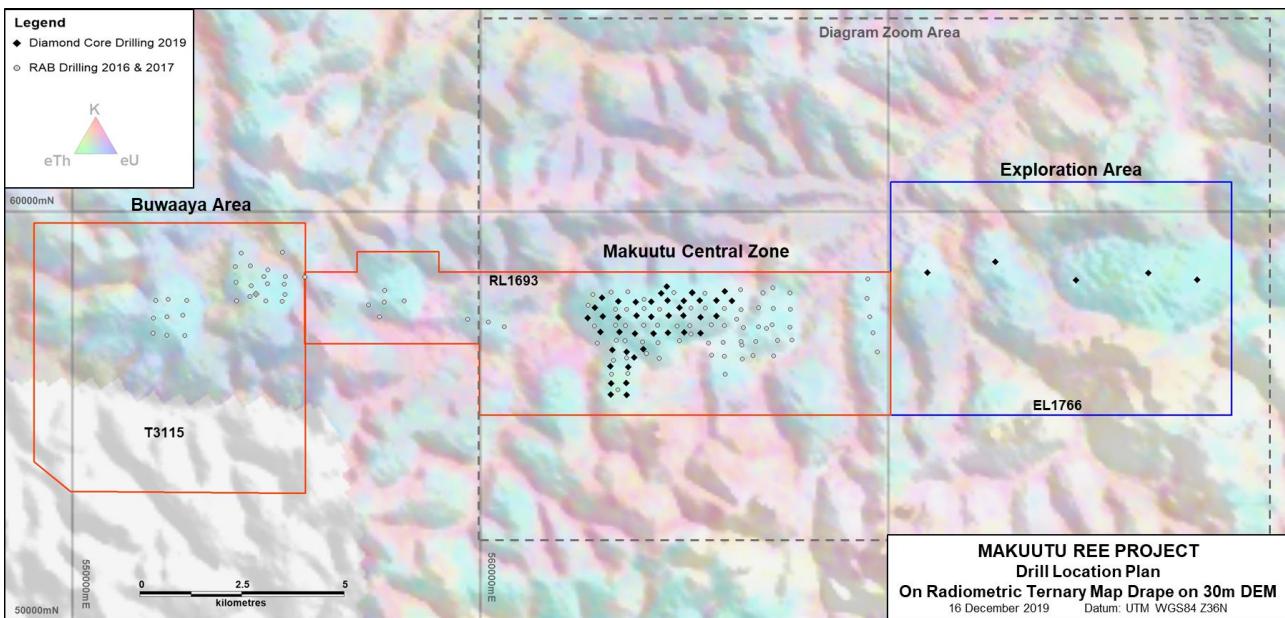

Figure 1. Makutu REE Project Exploration Target Areas on Ternary Radiometric Base.
Grey markings indicate RAB drill holes (2016 & 2017) and black markings indicate 2019 core drill holes

Exploration Drilling in Exploration Licence (EL) 1766

Broad spaced drilling of 5 diamond core holes were completed on the untested laterite plateaus between 6 and 12 kilometres east of the Makuutu Central Zone. The plateaus are considered geologically analogous to those hosting the known Makuutu Rare Earth (REE) mineralisation although no previous exploration had been undertaken to test the potential for REE in the area.

All drill holes (RRMDD042 to RRMDD046) encountered a similar lateritic weathering profile as seen in the Makuutu central zone. Near surface REE mineralisation over 500 ppm TREO hosted in clays, was intersected in all holes. The intersections are summarised as follows and displayed on Figure 2:

- RRMDD042: 4.4 metres @ 981 ppm TREO from 3.80 metres
- RRMDD043: 3.5 metres @ 589 ppm TREO from 2.95 metres
- RRMDD044: 2.0 metres @ 617 ppm TREO from 2.70 metres
- RRMDD045: 7.2 metres @ 556 ppm TREO from 0.95 metres
- RRMDD046: 5.5 metres @ 642 ppm TREO from 3.75 metres

Further drilling is anticipated for 2020 to evaluate this large area and further define mineralisation, and gain data on grade distribution and recovery.

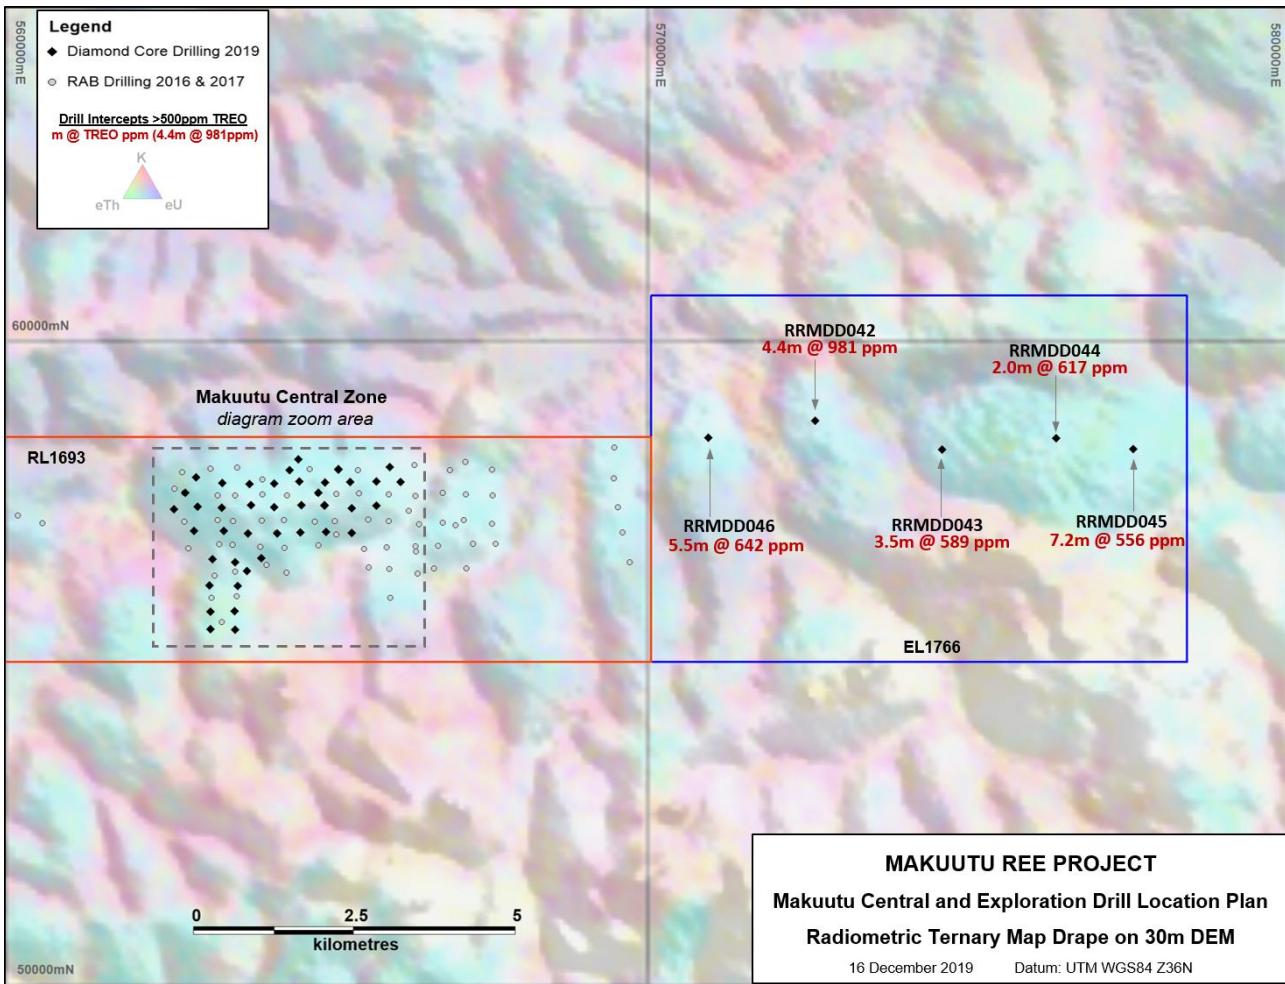

Figure 2. Drilling Location Plan Makuutu REE Project showing EL1766 Exploration Drill Holes Clay Intercepts >500ppm TREO

Makuutu Central Zone (MCZ) Drilling

The MCZ drill program was designed to provide core drilling samples to provide high-quality core necessary to retrieve suitable sample for grade measurement and geological analysis, resource estimation and ensuing metallurgical testing. The drilling program consisted of 41 core holes and 3 window sampler holes in tenement RL 1693.

The locations of the holes drilled in this program are illustrated in Figures 1 and 2. The holes were generally drilled in a 400-metre spacing, and between existing RAB drilling holes, to allow for a greater spatial coverage and complimentary data; in a few areas holes were drilled closer to allow for geostatistical analysis and resulting insights to requirements for the following drill program.

Drilling Results MCZ

All data has been received from the drilling program. Figure 3 shows the hole locations and clay intersections for these holes. All have intersected clay mineralised at greater than 500 ppm TREO, except holes RMD022 and RRMDD025 which are located on the south west margin of the drilled area. The clay mineralisation intersections greater than 500 ppm TREO achieved in the drilling of this area have an average thickness of 6.3 metres, within an area of approximately 4.3 square kilometres.

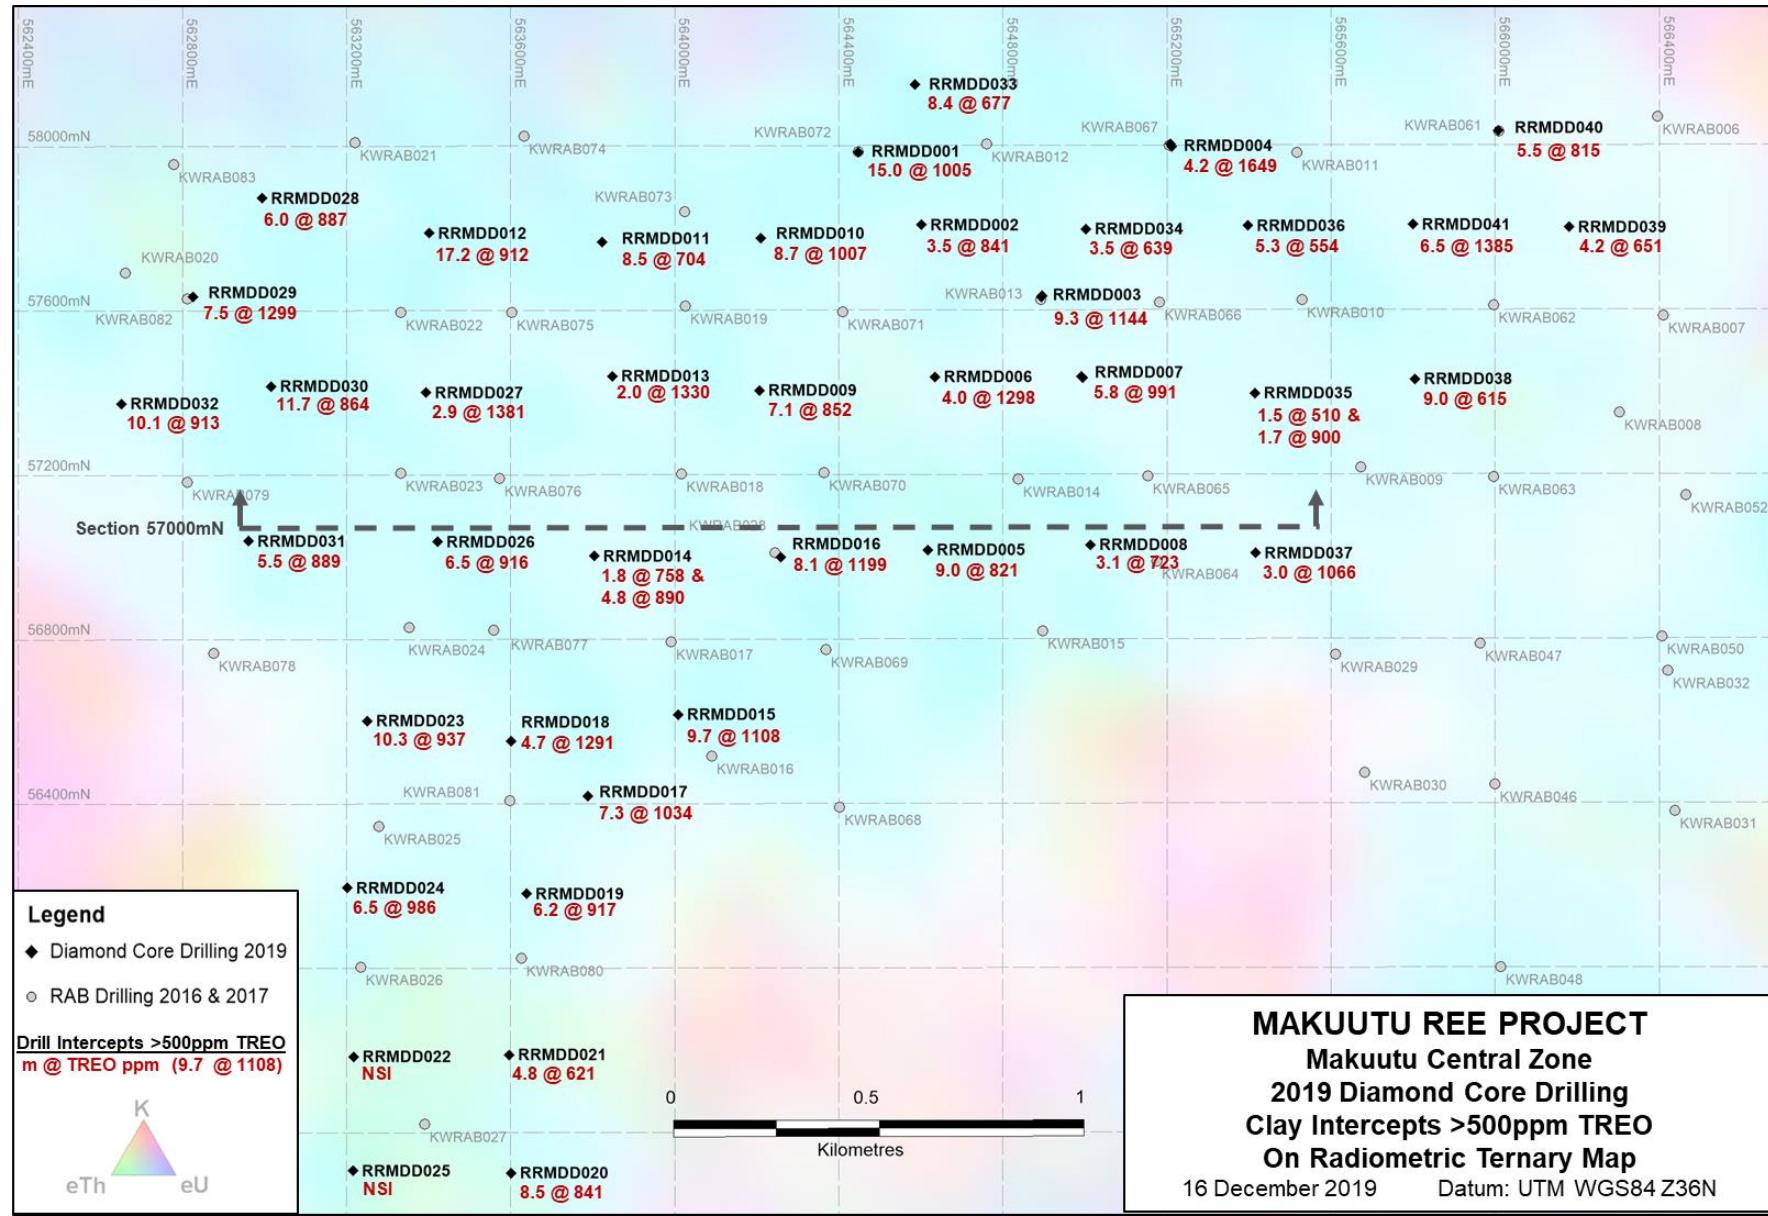

Figure 3. Makuutu Project; Plan of All Drill Holes With Clay Intercept Drill Results (Red). Map dimensions 4.5 km x 2.8 km.

Drill intersections to date containing significant near-surface grades and thicknesses of clay-hosted Rare Earth mineralisation include (*previously reported results that were announced to the ASX on 21 Nov 2019 and 10 Dec 2019 are italicised*):

RRMDD001: 15.0 metres @ 1,005 ppm TREO from 5.10 metres
RRMDD003: 9.3 metres @ 1,144 ppm TREO from 2.87 metres
RRMDD004: 4.2 metres @ 1,649 ppm TREO from 5.62 metres
RRMDD005: 9.0 metres @ 821 ppm TREO from 7.40 metres
RRMDD006: 4.0 metres @ 1,298 ppm TREO from 3.50 metres
RRMDD010: 8.7 metres @ 1,007 ppm TREO from 3.87 metres
RRMDD012: 17.2 metres @ 912 ppm TREO from 2.22 metres
RRMDD013: 2.0 metres @ 1,330 ppm TREO from 5.35 metres
RRMDD015: 9.7 metres @ 1,108 ppm TREO from 3.70 metres
RRMDD016: 8.1 metres @ 1,199 ppm TREO from 2.50 metres
RRMDD017: 7.3 metres @ 1,034 ppm TREO from 1.50 metres
RRMDD018: 4.7 metres @ 1,291 ppm TREO from 6.87 metres
RRMDD023: 10.6 metres @ 923 ppm TREO from 3.40 metres
RRMDD029: 7.5 metres @ 1,299 ppm TREO from 6.0 metres
RRMDD032: 10.1 metres @ 913 ppm TREO from 1.50 metres
RRMDD037: 3.0 metres @ 1,066 ppm TREO from 3.10 metres
RRMDD041: 6.50 metres @ 1,385 ppm TREO from 4.70 metres

Figure 4 shows a simplified geology cross section annotated with drill results. The section width covers over 2.4 kilometres and shows the extensive distribution of the mineralisation and the consistency of the weathered profile hosting the Rare Earth mineralisation. Details of the core drill holes are provided in Appendix 1 and full core assay details for the results received to date are contained in Appendix 2 of this announcement.

The weathered profile is typically comprised of a surface laterite caprock, underlain by clays grading to saprock with fresh sediments at the base. The caprock is variably overlain by recent alluvial soils, up to 1 m thick. All the weathered components host REO mineralisation.

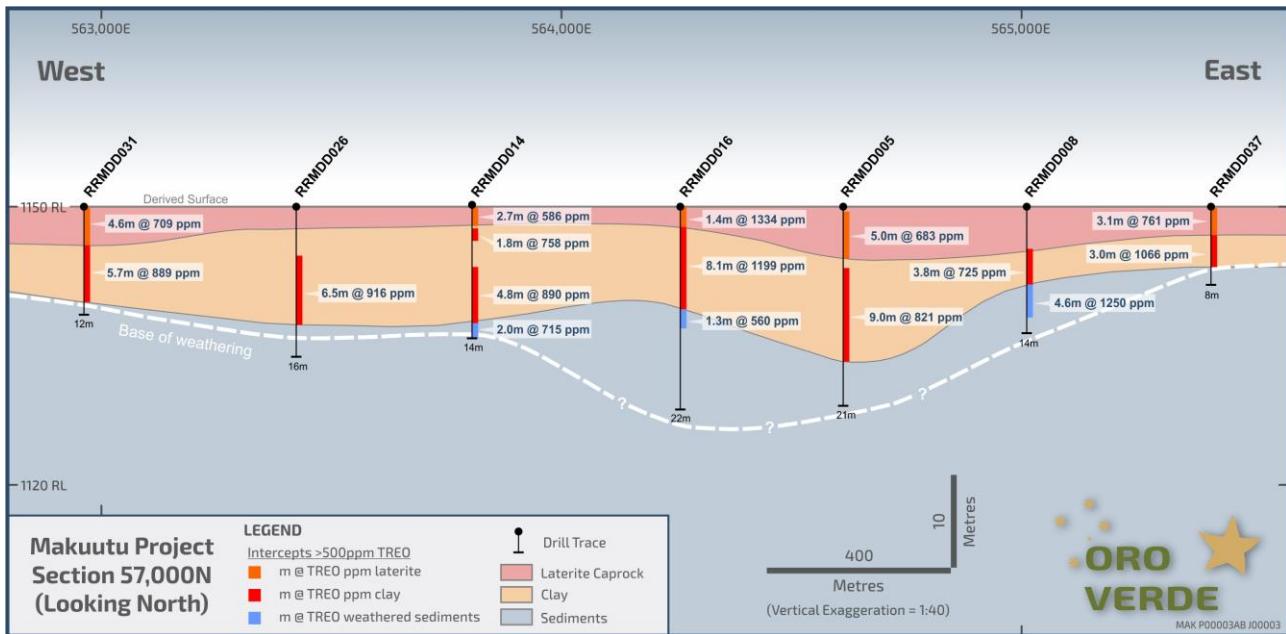

Figure 4. Makuutu REE Project; Cross Section of Simplified Geology and Drill Results.¹

Competent Persons Statement

The information in this Report that relates to Exploration Results for the Makuutu Project is based on information compiled by Mr. Geoff Chapman, who is a Fellow of the Australian Institute of Mining and Metallurgy (AusIMM). Mr. Chapman is a Director of geological consultancy GJ Exploration Pty Ltd that is engaged by Oro Verde Limited. Mr. Chapman has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves' (JORC Code). Mr. Chapman consents to the inclusion in this report of the matters based on the information in the form and context in which it appears.

Information in this report that relates to previously reported Exploration Targets and Exploration Results has been cross-referenced in this report to the date that it was originally reported to ASX. Oro Verde Limited confirms that it is not aware of any new information or data that materially affects information included in the relevant market announcements.

¹ The surface level is shown as fixed level of 1150 m as the vertical exaggeration required to capture the section width reduces the representivity of the diagram. Elevation change from west to east is approximately -30 metres.

JORC Code, 2012 Edition – Table 1 report

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	<ul style="list-style-type: none"><i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i><i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i><i>In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	Diamond Core Drilling Drill core was collected from a core barrel and placed in appropriately marked core trays. Down hole core run depths were measured and marked with core blocks. Core was measured for core loss and core photography and geological logging completed. Sample lengths were determined by geological boundaries with a maximum sample length of 1 metre applied in clay zones and up to 2 metres in laterite zones where core recovery was occasionally low. Where the core contained continuous lengths of soft clay a carving knife was used to cut the core. When the core was too hard to knife cut it was cut using an electric core saw. Using either method core was initial cut in half then one half was further cut in half to give quarter core. Quarter core was submitted to ALS for chemical analysis using industry standard sample preparation and analytical techniques. Half core was collected for metallurgical testwork.
Drilling techniques	<ul style="list-style-type: none"><i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	Diamond Core Drilling Core size was HQ triple tube. The core was not oriented (vertical)
Drill sample recovery	<ul style="list-style-type: none"><i>Method of recording and assessing core and chip sample recoveries and results assessed.</i><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i><i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	Diamond Drilling Core recovery was calculated by measuring actual core length versus drillers core run lengths. Core recovery ranged from 70% to 100% and averaged 97%. No relationship exists between core recovery and grade.

Criteria	JORC Code explanation	Commentary				
Logging	<ul style="list-style-type: none"> Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. The total length and percentage of the relevant intersections logged. 	<p>All (100%) drill core has been geologically logged and core photographs taken.</p> <p>Logging is qualitative with description of colour, weathering status, alteration, major and minor rock types, texture, grain size and comments added where further observation is made.</p> <p>Additional non-geological qualitative logging includes comments for sample recovery, humidity, and hardness for each logged interval.</p>				
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> If core, whether cut or sawn and whether quarter, half or all core taken. If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. For all sample types, the nature, quality and appropriateness of the sample preparation technique. Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. Whether sample sizes are appropriate to the grain size of the material being sampled. 	<p>Diamond Drill Core</p> <p>Where the core contained continuous lengths of soft clay a carving knife was used to cut the core. When the core was too hard to knife cut it was cut using an electric core saw.</p> <p>Sample lengths were determined by geological boundaries with a maximum sample length of 1 metre applied in clay zones and up to 2 metres in laterite zones where core recovery was occasionally low.</p> <p>Samples were collected from core trays by hand and placed in individually numbered bags. These bags were dispatched to ALS for analysis with no further field preparation.</p> <p>Sample weights were recorded prior to sample dispatch. Sample mass is considered appropriate for the grain size of the material being sampled that is generally very fine grained and uniform.</p> <p>Field duplicate sampling was conducted at a ratio of 1:25 samples. Duplicates were created by lengthways halving the ¼ core primary sample into 2 identical portions. Duplicate samples were allocated separate sample numbers and submitted with the same analytical batch as the primary sample.</p>				
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. 	<p>Assay and Laboratory Procedures – All Samples</p> <p>Samples were dispatched by air freight direct to ALS laboratory Perth Australia. The preparation and analysis protocol used is as follows:</p> <table border="1" data-bbox="1246 1278 2122 1397"> <thead> <tr> <th data-bbox="1246 1278 1695 1341">ALS Code</th><th data-bbox="1695 1278 2122 1341">Description</th></tr> </thead> <tbody> <tr> <td data-bbox="1246 1341 1695 1397">WEI-21</td><td data-bbox="1695 1341 2122 1397">Received sample weight</td></tr> </tbody> </table>	ALS Code	Description	WEI-21	Received sample weight

Criteria	JORC Code explanation	Commentary
		<p><u>Diamond Drill Core Samples</u></p> <ul style="list-style-type: none"> • Analytical Standards <p>CRM AMIS0275 and AMIS0276 were included in sample batches at a ratio of 1:25 to drill samples submitted. This is an acceptable ratio.</p> <p>The assay results for the standards were consistent with the certified levels of accuracy and precision and no bias is evident.</p> <ul style="list-style-type: none"> • Blanks <p>CRM blanks AMIS0681 and OREAS22e were included in sample batches at a ratio of 1:25 to drill samples submitted for analysis. This is an acceptable ratio.</p> <p>Both CRM blanks contain some REE, with elements critical elements Ce, Nd, Dy and Y present in small quantities. The analysis results were consistent with the certified values for the blanks. No laboratory contamination or bias is evident from these results.</p> <ul style="list-style-type: none"> • Duplicates <p>Field duplicate sampling was conducted at a ratio of 1:25 samples. Duplicates were created by lengthways halving the $\frac{1}{4}$ core primary sample into 2 identical portions. Duplicate samples were allocated separate sample numbers and submitted with the same analytical batch as the primary sample. Variability between duplicate results is considered acceptable and no sampling bias is evident.</p> <p>Laboratory inserted standards, blanks and duplicates were analysed as per industry standard practice. There is no evidence of bias from these results.</p>
Verification of sampling and assaying	<ul style="list-style-type: none"> • The verification of significant intersections by either independent or alternative company personnel. • The use of twinned holes. • Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. • Discuss any adjustment to assay data. 	<p>No independent verification of significant intersection undertaken.</p> <p>No twinning of diamond core drill holes was undertaken.</p> <p>Sampling protocols for diamond core sampling and QAQC were documented and held on site by the responsible geologist. No procedures for data storage and management have been compiled as yet.</p> <p>Data were collected in the field by hand and entered into Excel spreadsheet. Data are then compiled with assay results compiled and stored in Access database. Data verification is conducted on data entry including hole depths, sample intervals and sample numbers. Sample</p>

Criteria	JORC Code explanation	Commentary																																										
		<p>numbers from assay data are verified by algorithm in spreadsheet prior to entry int the database.</p> <p>Assay data was received in digital format from the laboratory and merged with the sampling data into an Excel spreadsheet format for QAQC analysis and review against field data. Once finalised and validated data is stored in a protected Access database.</p> <p>Data validation of assay data and sampling data have been conducted to ensure data entry is correct.</p> <p>All assay data is received from the laboratory in element form is unadjusted for data entry.</p> <p>Conversion of elemental analysis (REE) to stoichiometric oxide (REO) was undertaken by spreadsheet using defined conversion factors.(Source:https://www.jcu.edu.au/advanced-analytical-centre/services-and-resources/resources-and-extras/element-to-stoichiometric-oxide-conversion-factors)</p> <table border="1"> <thead> <tr> <th>Element ppm</th><th>Conversion Factor</th><th>Oxide Form</th></tr> </thead> <tbody> <tr> <td>Ce</td><td>1.1713</td><td>Ce₂O₃</td></tr> <tr> <td>Dy</td><td>1.1477</td><td>Dy₂O₃</td></tr> <tr> <td>Er</td><td>1.1435</td><td>Er₂O₃</td></tr> <tr> <td>Eu</td><td>1.1579</td><td>Eu₂O₃</td></tr> <tr> <td>Gd</td><td>1.1526</td><td>Gd₂O₃</td></tr> <tr> <td>Ho</td><td>1.1455</td><td>Ho₂O₃</td></tr> <tr> <td>La</td><td>1.1728</td><td>La₂O₃</td></tr> <tr> <td>Lu</td><td>1.1371</td><td>Lu₂O₃</td></tr> <tr> <td>Nd</td><td>1.1664</td><td>Nd₂O₃</td></tr> <tr> <td>Pr</td><td>1.1703</td><td>Pr₂O₃</td></tr> <tr> <td>Sm</td><td>1.1596</td><td>Sm₂O₃</td></tr> <tr> <td>Tb</td><td>1.151</td><td>Tb₂O₃</td></tr> <tr> <td>Tm</td><td>1.1421</td><td>Tm₂O₃</td></tr> </tbody> </table>	Element ppm	Conversion Factor	Oxide Form	Ce	1.1713	Ce ₂ O ₃	Dy	1.1477	Dy ₂ O ₃	Er	1.1435	Er ₂ O ₃	Eu	1.1579	Eu ₂ O ₃	Gd	1.1526	Gd ₂ O ₃	Ho	1.1455	Ho ₂ O ₃	La	1.1728	La ₂ O ₃	Lu	1.1371	Lu ₂ O ₃	Nd	1.1664	Nd ₂ O ₃	Pr	1.1703	Pr ₂ O ₃	Sm	1.1596	Sm ₂ O ₃	Tb	1.151	Tb ₂ O ₃	Tm	1.1421	Tm ₂ O ₃

		<p>Rare earth oxide is the industry accepted form for reporting rare earths. The following calculations are used for compiling REO into their reporting and evaluation groups:</p> <p>TREO (Total Rare Earth Oxide) = $\text{La}_2\text{O}_3 + \text{Ce}_2\text{O}_3 + \text{Pr}_2\text{O}_3 + \text{Nd}_2\text{O}_3 + \text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_2\text{O}_3 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3 + \text{Y}_2\text{O}_3 + \text{Lu}_2\text{O}_3$.</p> <p>Note that Y_2O_3 is included in the TREO calculation.</p> <p>HREO (Heavy Rare Earth Oxide) = $\text{Sm}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Gd}_2\text{O}_3 + \text{Tb}_2\text{O}_3 + \text{Dy}_2\text{O}_3 + \text{Ho}_2\text{O}_3 + \text{Er}_2\text{O}_3 + \text{Tm}_2\text{O}_3 + \text{Yb}_2\text{O}_3, + \text{Y}_2\text{O}_3 + \text{Lu}_2\text{O}_3$</p> <p>CREO (Critical Rare Earth Oxide) = $\text{Nd}_2\text{O}_3 + \text{Eu}_2\text{O}_3 + \text{Tb}_2\text{O}_3 + \text{Dy}_2\text{O}_3 + \text{Y}_2\text{O}_3$</p> <p>LREO (Light Rare Earth Oxide) = $\text{La}_2\text{O}_3 + \text{Ce}_2\text{O}_3 + \text{Pr}_2\text{O}_3 + \text{Nd}_2\text{O}_3$</p> <p>HREO% of TREO= HREO/TREO x 100</p> <p>In elemental form the classifications are:</p> <p>TREE: La+Ce+Pr+Nd+Sm+Eu+Gd+Tb+Dy+Ho+Er+Tm+Yb+Lu+Y</p> <p>CREE: Nd+Eu+Tb+Dy+Y</p> <p>LREE: La+Ce+Pr+Nd</p>						
Location of data points	<ul style="list-style-type: none"> Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. Specification of the grid system used. Quality and adequacy of topographic control. 	<p>Drill hole collar locations for holes RRMDD001 to RRMDD041 were surveyed a relational DGPS system. The general accuracy for x,y and z is $\pm 0.2\text{m}$.</p> <p>Hole locations for RRMDD042 – RRMDD046 were surveyed using handheld GPS. The accuracy for this type of device is considered $\pm 5\text{m}$ in x and y coordinates however the elevation component of coordinates is variable and z accuracy may be low using this type of device.</p> <p>Datum WGS84 Zone 36 North was used for location data collection and storage. This is the appropriate datum for the project area. No grid transformations were applied to the data.</p>						

Criteria	JORC Code explanation	Commentary
		<p>No downhole surveys were conducted. As all holes were vertical and shallow, the rig setup was checked using a spirit level for horizontal and vertical orientation Any deviation will be insignificant given the short lengths of the holes</p> <p>Detailed topographic data was not sourced or used.</p>
Data spacing and distribution	<ul style="list-style-type: none"> • Data spacing for reporting of Exploration Results. • Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied. 	<p>Drilling was conducted on a nominal 400m x 400m spacing. Historic RAB drilling has also been conducted on this spacing however the diamond drilling was offset by 200m from the RAB drilling</p> <p>Exploration drill holes on EL1766 were drilled where convenient on ternary and elevation anomalies and are not to any specific spacing.</p> <p>There has been no resource estimate made on the project.</p>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> • Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. 	<p>The Makuutu mineralisation is interpreted to be in a flat lying weathered profile including cover soil, lateritic caprock, clays transitioning to saprolite and saprock. Below the saprock are fresh shales, siltstones and mudstones. Pit mapping and diamond drilling indicate the mineralised regolith to be generally horizontal</p> <p>All drill holes are vertical which is appropriate for horizontal bedding and regolith profile.</p>
Sample security	<ul style="list-style-type: none"> • The measures taken to ensure sample security. 	<p>After collection, the samples were transported by Company representatives to Entebbe airport and dispatched via airfreight to Perth Australia. Samples were received by Australian customs authorities in Perth within 48 hours of dispatch and were still contained in the sealed shipment bags.</p> <p>Samples were subsequently transported from Australian customs to ALS Perth via road freight and inspected on arrival by a Company representative.</p>
Audits or reviews	<ul style="list-style-type: none"> • The results of any audits or reviews of sampling techniques and data. 	No audits or reviews have been undertaken

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary									
Mineral tenement and land tenure status	<ul style="list-style-type: none"> <i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i> 	<p>The Makuutu Project comprises one (1) granted Retention Licence (RL1693), one (1) Retention Licence application (TN3115), and one (1) Exploration Licence (EL1766).</p>									
<p>The granted tenements RL1693 and EL1766 are in good standing and no known impediments exist. The application T3115 was formerly a portion of a larger Exploration Licence. Exploration work conducted on this licence included 27 RAB holes, the only diamond drill hole and 19 of the 2012 pits. The application area is excluded from field work until grant of TN3115.</p>											
		<p>All licences are located in Republic of Uganda.</p>									
		<p>All licences are held 100% by Ugandan registered Rwenzori Rare Metals Limited (RRM) which in turn is owned 85% by South African registered Rare Earth Elements Africa Proprietary Limited (REEA)</p>									
		<p>Oro Verde has entered into a binding option agreement with both companies that enables it to acquire up to a 60% direct interest in RRM, and thereby up to a 60% indirect interest in the Project by:</p>									
	<ol style="list-style-type: none"> 1. The payment of US\$10,000 for a 30-day exclusive option period; 2. Upon exercise of the option, the payment of US\$100,000 cash and issuing US\$150,000 in Oro Verde shares, at a 30-day VWAP in return for an immediate 20% interest in RRM; 3. OVL to contribute US\$1,700,000 of expenditure by 1 October 2020 to earn up to a 51% staged interest in RRM as follows 										
		<table border="1"> <thead> <tr> <th data-bbox="1260 1116 1747 1200">Spend</th><th data-bbox="1758 1116 1859 1200">Interest earned</th><th data-bbox="1870 1116 2091 1200">Cumulative Interest earned</th></tr> </thead> <tbody> <tr> <td data-bbox="1260 1200 1747 1303">Exercise of Option US\$100,000 as in 2 above</td><td data-bbox="1758 1200 1859 1303">20%</td><td data-bbox="1870 1200 2091 1303">20%</td></tr> <tr> <td data-bbox="1260 1303 1747 1384">Expenditure contribution of US\$650,000</td><td data-bbox="1758 1303 1859 1384">11%</td><td data-bbox="1870 1303 2091 1384">31%</td></tr> </tbody> </table>	Spend	Interest earned	Cumulative Interest earned	Exercise of Option US\$100,000 as in 2 above	20%	20%	Expenditure contribution of US\$650,000	11%	31%
Spend	Interest earned	Cumulative Interest earned									
Exercise of Option US\$100,000 as in 2 above	20%	20%									
Expenditure contribution of US\$650,000	11%	31%									

Criteria	JORC Code explanation	Commentary		
		Expenditure contribution of further US\$800,000	15%	46%
		<p>4. Oro Verde to fund to completion of a bankable feasibility study to earn an additional 9% interest for a cumulative 60% interest in RRM.</p> <p>5. During the earn-in phase there are milestone payments, payable in cash or Oro Verde shares at the election of the Vendor, as follows:</p> <ul style="list-style-type: none"> • US\$750,000 on the Grant of Retention licence over RL1693 which is due to expire in November 2020; • US\$375,000 on production of 10 kg of mixed rare-earth product from pilot or demonstration plant activities; and • US\$375,000 on conversion of existing licences to mining licences. • At any time should Oro Verde not continue to invest in the project and project development ceases for at least two months RRM has the right to return the capital sunk by Oro Verde and reclaim all interest earnt by Oro Verde. 		
Exploration done by other parties	<ul style="list-style-type: none"> • Acknowledgment and appraisal of exploration by other parties. 	<p>Previous exploration includes:</p> <p>1980: Country wide airborne geophysical survey identifying uranium anomalies in the Project area.</p> <p>1990s: French BRGM and Ugandan DGSM undertook geochemical and geological survey over South-Eastern Uganda including the Project area. Anomalous Au, Zn, Cu, Sn, Nb and V identified.</p> <p>2006-2009: Country wide high resolution airborne magnetic and radiometric survey identified U anomalous in the Project area.</p> <p>2009: Finland GTK reprocessed radiometric data and refined the Project anomalies.</p> <p>2010: Kweri Ltd undertook field verification of radiometric anomalies including scout sampling of existing community pits. Samples showed an enrichment of REE and Sc.</p> <p>2011: Kweri Ltd conducted ground radiometric survey and evaluated historic groundwater borehole logs.</p>		

Criteria	JORC Code explanation	Commentary
		<p>2012: Kweri Ltd and partner Berkley Reef Ltd conducted prospect wide pit excavation and sampling of 48 pits and a ground gravity traverse. Pit samples showed enrichment of REE weathered profile. Five (5) samples sent to Toronto Aqueous Research Laboratory for REE leach testwork.</p> <p>2016 – 2017: Rwenzori Rare Metals conduct excavation of 11 pits, ground gravity survey, RAB drilling (109 drill holes) and one (1) diamond drill hole.</p> <p>The historic exploration has been conducted to a professional standard and is appropriate for the exploration stage of the prospect.</p>
Geology	<ul style="list-style-type: none"> • Deposit type, geological setting and style of mineralisation. 	<p>The Makuutu deposit is interpreted to be an ionic adsorption REE clay-type deposits similar to those in South China, Madagascar and Brazil. The mineralisation is contained within the tropical lateritic weathering profile of a basin filled with sedimentary rocks including shales, mudstones and sandstones potentially derived from the surrounding granitic rocks. These granitic rocks are considered the original source of the REE which were then accumulated in the sediments of the basin as the granites have degraded. These sediments then form the protolith that was subjected to prolonged tropical weathering.</p> <p>The weathering developed a lateritic regolith with a surface indurated hardcap, followed downward by clay rich zones that grade down through saprolite and saprock to unweathered sediments. The thickness of the regolith is between 10 and 20 metres from surface.</p> <p>The REE mineralisation is concentrated in the weathered profile where it has dissolved from its primary mineral form, such as monazite and xenotime, then adsorbed on to fine particles of aluminosilicate clays (e.g. kaolinite, illite, smectite). This adsorbed REE is the target for extraction and production of REO.</p> <p>There is insufficient geological study to determine any geological disruptions, such as faults or dykes, that may cause variability in the mineralisation.</p>
Drill hole Information	<ul style="list-style-type: none"> • A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: 	<p>The material information for drill holes relating to this announcement are contained in Appendix 1.</p>

Criteria	JORC Code explanation	Commentary
	<ul style="list-style-type: none"> ○ <i>easting and northing of the drill hole collar</i> ○ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> ○ <i>dip and azimuth of the hole</i> ○ <i>down hole length and interception depth</i> ○ <i>hole length.</i> <ul style="list-style-type: none"> ● <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i> 	
Data aggregation methods	<ul style="list-style-type: none"> ● <i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> ● <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i> ● <i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i> 	<p>A lower cut-off of 500 ppm TREO was used for data aggregation of significant intervals with a maximum of 2 metres of internal dilution and no top-cuts applied.</p> <p>Significant intervals were tabulated downhole for reporting. All individual samples were included in length weighted averaging over the entire tabulated range.</p> <p>No metal equivalents values are used.</p>
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> ● <i>These relationships are particularly important in the reporting of Exploration Results.</i> ● <i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i> ● <i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i> 	<p>Down hole lengths, true widths are not known.</p> <p>The mineralisation is interpreted to be horizontal, flat lying sediments and weathering profile, with the vertical drilling perpendicular to mineralisation. Any internal variations to REE distribution within the horizontal layering was not defined, therefore the true width is considered not known.</p>
Diagrams	<ul style="list-style-type: none"> ● <i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i> 	<p>Refer to diagrams in body of text.</p>

Criteria	JORC Code explanation	Commentary
Balanced reporting	<ul style="list-style-type: none"> Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results. 	<p>This report contains all drilling results that are consistent with the JORC guidelines. Where data may have been excluded, it is considered not material.</p>
Other substantive exploration data	<ul style="list-style-type: none"> Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. 	<p>Metallurgical leach testing was previously conducted on samples derived from exploration pits, RAB drilling, and one 8.5 tonne bulk pit sample.</p> <p>In 2012, 5 pit samples were sent to the Toronto Aqueous Research Laboratory at the University of Toronto for leachability tests</p> <p>In 2017, 2 pit samples were sent to SGS Laboratory Toronto for leachability tests.</p> <p>2017/18, 29 samples were collected from 7 RAB drill holes. 20 of these were consigned to SGS Canada and 4 to Aqueous Process Research (APR) in Ontario Canada. The remaining 5 samples were consigned to Bio Lantanidos in Chile.</p> <p>2018/19, 8.5 tonne bulk sample was consigned to Mintek, South Africa, to evaluate using Resin-in-leach (RIL) technology for the recovery of REE.</p> <p>Evaluation of results from these programs and testing from samples generated by the drilling program under this Table 1 is ongoing.</p>
Further work	<ul style="list-style-type: none"> The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive. 	<p>Future work programs are intended to evaluate the economic opportunity of the project including extraction recovery maximisation, resource definition and estimation on the known areas of mineralisation, regional exploration on adjoining licences and compilation of a Preliminary Economic Assessment (PEA)</p>
