

Quarterly report and activity statement

3 months to 31 December 2023

Highlights

Rare earths (ionic adsorption clay resource in Tasmania)

Resource increased to 52 million tonnes averaging 817 ppm TREO and 633 ppm TREO-CeO₂ at a cut-off grade of 350 ppm TREO-CeO₂

66-hole drilling campaign conducted from October to December, including the first drilling program dedicated to rare earths at the Wind Break deposit

Initial assay results were received post the end of the quarter, which confirmed that ABx's northern Tasmanian exploration target area exceeds 100 km²

Production of hydrogen fluoride and aluminium fluoride from aluminium smelter waste (ALCORE)

Bath pilot batch reactor was commissioned and commenced operations

Three test runs were completed under standard process conditions. Observations and preliminary results indicate that the enhanced process mixing is delivering higher fluorine yield in a single pass

Commercial discussions continued with potential strategic investors

Bauxite Operations (Queensland and Tasmania)

It is understood that Adelaide Bright Cement has used the trial shipment of ABx bauxite material in its cement manufacturing operation with no significant issues

390 tonnes of bauxite were excavated from a trial pit and provided to a customer. A further 600 tonnes will be excavated in January

Corporate

Group available cash at quarter end was \$5.82 million. Post the end of the quarter, \$615,960 was raised in a Share Purchase Plan

At 2 January 2024, ABx securities total 250,040,314 ordinary shares

ABx subscribed to Socialsuite's reporting platform to assist with monitoring and disclosing progress against ESG metrics

ABx Group (ASX: ABX) is a uniquely positioned, high-tech Australian company delivering materials for a cleaner future.

Rare Earths: resource increased to over 50 million tonnes

- The mineral resource estimate was increased to 52 million tonnes¹ averaging 817 ppm TREO and 633 ppm TREO-CeO₂.² The resource has the highest proportion of dysprosium and terbium (Dy+Tb is 4.4% of TREO) of any clay-hosted rare earths resource in Australia.
- An 66-hole drilling program was conducted from October to December. This was designed to test step-out locations from ABx's previous drilling campaign, which intersected the highest assays to date.³
- Initial drilling was conducted at the Wind Break deposit, the first drilling program dedicated to rare earths at this location. This was supported by funding from Mineral Resources Tasmania for Round 8 of the Exploration Drilling Grant Initiative (EDGI). The funding is for up to a maximum of \$70,000 on a dollar-for-dollar basis.⁴ Initial assay results were received post the end of the quarter, which confirmed that ABx's northern Tasmanian exploration target area exceeds 100 km².⁵
- The remainder of the drilling program was conducted at the northern extensions of the Deep Leads – Rubble Mound resource. Assay results are expected in January and February 2024
- Exploration licence application EL25/2022 covering the 16 km extension from Deep Leads / Rubble Mound to the Wind Break REE discovery area is in progress.
- Ongoing discussions with several potential customers continued to endorse the ABx strategy of producing a mixed rare earth carbonate (MREC) for sale to a separation plant. The discussions highlighted the acute supply risks for dysprosium and terbium in particular.

Rare Earths Strategy

Rare earths have many applications in a wide variety of industries. Permanent magnets are the most valuable application, representing over 90% of the total value of rare earths demand. Permanent magnets are used in electric vehicles, wind turbines, smartphones and military applications. The four most important rare earths for permanent magnets are neodymium, praseodymium, dysprosium and terbium. The demand for these four rare earths is predicted to grow significantly in coming years, potentially leading to significant supply shortfalls. The supply risk is highest for dysprosium and terbium, the two heavy rare earths in permanent magnets.

Globally, most rare earths are sourced from hard-rock mines. These typically require large, costly processing plants and a significant lead time to reach production.

A less common source of rare earths is ionic adsorption clay (IAC) deposits, which have historically been mined only in southern China. A major advantage of IAC deposits is that the rare earths can be extracted from the clay via a low-cost desorption process. Secondly, they often exist at shallow depth. These advantages enable a project to be developed rapidly and at lower cost. Furthermore, IAC deposits typically contain a higher proportion of heavy rare earths compared to hard rock deposits, and low concentrations of radioactive elements such as uranium and thorium.

ABx is the first company to discover rare earths in Tasmania (Figure 1) and has reported a JORC-compliant mineral resource of 52 million tonnes at its Deep Leads / Rubble Mound project.

ABx engaged Australian Nuclear Science and Technology Organisation (ANSTO) to conduct desorption tests, which found the highest extractions under relatively neutral conditions reported from any clay-hosted project in Australia^{6,7}. This proves the mineralisation to be of the IAC type. Low-cost processing is crucial for clay-hosted rare earth deposits, and industry processing experts indicate that low-cost processing can only be achieved using desorption with low acid consumption. Additionally, the rare earths in the Deep Leads / Rubble Mound resource have the highest proportion of dysprosium and terbium (Dy+Tb is 4.4% of TREO) of any clay-hosted rare earths resource in Australia. Furthermore, the level of radioactive elements is very low (2 ppm U₂O₃ and 6 ppm ThO). These factors put ABx at the forefront for customers and countries seeking to diversify rare earths supply.

Following these excellent discovery and processing results, ABx has built significant momentum and will continue to conduct further exploration, which will include targeting new areas within its tenements that have geological features considered prospective for additional rare earths.

The ABx strategy is to produce a mixed rare earth carbonate (MREC) that can be sold to rare earth separation plants, which produces separated rare earth oxides. The ABx MREC will be high in heavy rare earths and low in radioactive elements, which is expected to be attractive to many prospective customers. Market discussions with several potential customers endorse this strategy.

ALCORE: positive results from bath pilot batch reactor

- The bath pilot batch reactor was commissioned and commenced operations.⁸ The new reactor is approximately ten times larger than the Company's previous laboratory-scale reactor
- Three test runs were completed under standard process conditions (Figure 2).⁹ Each run involved approximately 10 kg total of bath and sulfuric acid. Following two runs and minor equipment modifications, the reactor is now performing as designed. In particular, the reactor is achieving enhanced process mixing.
- Hydrogen fluoride gas was successfully produced throughout each of the test runs. In the most recent run, several kilograms of metal sulfate powder were produced (Figure 3) that appeared similar to the powder previously produced by more manual methods and multiple processing steps using smaller reactors, where more than 90% of the fluorine was extracted.
- This gives confidence that the enhanced process mixing is delivering higher fluorine yield in a single pass, which is a highly significant milestone for the ongoing scale-up of the ALCORE process.
- Several powder samples from the runs have been sent to an external laboratory to measure the fluorine content and confirm the fluorine yield. Results from these independent assessments are anticipated in January 2024.
- Commercial discussions continued with potential strategic investors, and have included the possibility of locating the continuous pilot plant at an alternative, superior site, instead of the ALCORE Technology Centre on the NSW Central Coast. Ordering of continuous pilot plant reactors is being deferred until those commercial discussions are agreed.

ALCORE Strategy

Hydrogen fluoride is an essential chemical for the production of fluorocarbons and aluminium fluoride. Aluminium fluoride is an essential chemical for aluminium metal production. Fluorine has been recently added to Australia's critical minerals list.

Hydrogen fluoride is mainly produced from fluorspar, which is obtained from the mineral fluorite. Fluorspar is relatively high cost and has been identified as a critical material by the USA, Europe, Japan and Canada.

Australia does not mine any fluorite, or produce any fluorspar, hydrogen fluoride or aluminium fluoride, and so must import all its requirements. The Australian demand for hydrogen fluoride is small, and it is imported at high cost. Conversely, Australia is a significant producer of aluminium and so its demand for aluminium fluoride is high.

Australia is the largest producer of primary aluminium metal without its own domestic aluminium fluoride production, so Australian aluminium smelters rely entirely on imported aluminium fluoride. This is typically more than 80% from China, but this proportion was only 40% in 2021 when China production was lower, illustrating the supply risks (Figure 4). The median aluminium fluoride price (FOB China) for the last two years is over US\$1,400/t (Figure 5).

Most modern aluminium smelters produce excess bath, for which the only meaningful market is new smelters, which require bath to commence operations. Aluminium industry forecasts suggest that the global bath market will increasingly be in surplus, because far fewer new smelters are being constructed. All of the major global aluminium producers are eager for alternative applications for excess bath, to avoid the unpalatable options of on-site storage or landfill.

ALCORE has developed a world-first process to recover hydrogen fluoride from aluminium smelter bath. This is combined with aluminium hydroxide to produce aluminium fluoride. ALCORE is also investigating the use of dross (another aluminium smelter waste) and bauxite as alternatives to aluminium hydroxide as the source of aluminium. The use of dross or bauxite would further lower the production cost.

ALCORE intends to construct commercial hydrogen fluoride and aluminium fluoride plants in Bell Bay, Tasmania. The aluminium source for the initial aluminium fluoride production is likely to be aluminium hydroxide, as this is lower risk and allows a faster path to production. Subsequent production may use aluminium from dross or bauxite to further improve the financial and environmental outcomes.

The initial plant is proposed to transform 1,600 tonnes per year of aluminium smelter bath into hydrogen fluoride and other industrial chemicals. A proportion of the hydrogen fluoride will be further processed to aluminium fluoride. The relative amounts of hydrogen fluoride and aluminium fluoride produced can be optimised to suit market demand. ALCORE'S longer term plan is to expand the plant by 15 times, which will process all of Australia's aluminium smelter bath and supply more than 80% of Australia's aluminium fluoride requirements.

Figure 5: Aluminium fluoride monthly prices FOB China (source: China Customs Statistics)

Bauxite Operations

Sunrise Bauxite Project: Binjour, Queensland

- Survey reports of the Bundaberg port lease area are planned to commence in Q1, 2024
- The application to modify the site boundary at the Bundaberg port is continuing to be progressed by the Department of Resources.
- Environmental studies at the mine and port sites are being planned for Q1, 2024

DL130 Bauxite Project: Tasmania

- It is understood that Adelaide Bright Cement has used the trial shipment of ABx bauxite material in its cement manufacturing operation with no significant issues
- 390 tonnes of bauxite were excavated from a trial pit and provided to a customer. A further 600 tonnes will be excavated in January
- Some aspects of the mine lease application are taking longer than planned. These are not major issues, and they should all be straightforward to resolve, but commencement of mining is now expected in Q3 2024.

Bauxite Strategy

The ABx strategy is to selectively produce metallurgical grade, cement grade and fertiliser grade bauxite, with a focus on profitability. ABx bauxite can substantially improve the properties of superphosphate fertiliser.

The largest project is Binjour, with a JORC compliant resource of 37 million tonnes, supporting 20-25 years production. In February 2022, ABx entered a JV with Alumin for the development of the Sunrise Bauxite Project, comprising a bauxite mine at Binjour plateau and port operations at Bundaberg in Queensland¹⁰. Alumin is an Australian special purpose vehicle company associated with our strategic marketing partner, Rawmin India, having extensive experience in funding long term sustainable investments in projects involving mining and bulk-shipping of metallurgical grade bauxite to end users around the world.

It is anticipated that the mine at Binjour will export 500,000 tonnes per year of metallurgical grade bauxite in its first year of production, then scale up to full operational capacity of 1.5 million tonnes per year. ABx has reforecast its timeline to begin exporting of product in H2 2025.

In Tasmania, ABx has a JORC compliant resource of 13.7 million tonnes across three deposits. ABx plans to recommence bauxite mining in Tasmania by Q2 2024, at the DL130 Bauxite Project. The primary products are likely to be cement grade and fertiliser grade bauxite.

An updated company presentation has been placed on the ABx website www.abxgroup.com.au.

Qualifying statements

General: The information in this report that relate to Exploration Information and Mineral Resources are based on information compiled by Jacob Rebek and Ian Levy who are members of The Australasian Institute of Mining and Metallurgy and the Australian Institute of Geoscientists. Mr Rebek and Mr Levy are qualified geologists and Mr Levy is a director of ABx Group Limited.

Mainland: The information relating to Mineral Resources on the Mainland was prepared and first disclosed under the JORC Code 2004. It has not been updated since to comply with the JORC Code 2012 on the basis that the information has not materially changed since it was last reported. Mr Rebek and Mr Levy have sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which they are undertaking to qualify as a Competent Person as defined in the 2004 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Rebek and Mr Levy have consented in writing to the inclusion in this report of the Exploration Information in the form and context in which it appears.

Tasmania: The information relating to Exploration Information and Mineral Resources in Tasmania has been prepared or updated under the JORC Code 2012. Mr Rebek and Mr Levy have sufficient experience, which is relevant to the style of mineralisation and type of deposit under consideration and to the activity, which they are undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Rebek and Mr Levy have consented in writing to the inclusion in this report of the Exploration Information in the form and context in which it appears.

The information relating to the latest REE Resources update is extracted from the report entitled "ABx Rare Earth Resources Exceed 50 Million Tonnes" dated 20 November 2023 and is available to view on <https://www.abxgroup.com.au/site/investor-information/asx-announcements> (2023).

The Company confirms that it is not aware of any new information or data that materially affects the information included in the company's market announcements and, in the case of estimates of Mineral Resources or Ore Reserves, that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed.

The Company also confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Disclaimer Regarding Forward Looking Statements

This ASX announcement (Announcement) contains various forward-looking statements. All statements other than statements of historical fact are forward-looking statements. Forward-looking statements are inherently subject to uncertainties in that they may be affected by a variety of known and unknown risks, variables and factors which could cause actual values or results, performance or achievements to differ materially from the expectations described in such forward-looking statements.

ABx does not give any assurance that the anticipated results, performance or achievements expressed or implied in those forward-looking statements will be achieved.

Patent

Refined Ore Industries Ltd (ROIL) was the owner of the CORE process technology via ROIL's intellectual property company, Berkeley Process Technologies Pty. Ltd which issued a global exclusive licence for the aluminium-related portion of the CORE process technology to ABx in November 2017 and ABx has issued a global exclusive sub-licence to ALCORE when ALCORE was incorporated on 1 July 2018.

After a company restructure and expansion of the patent definition to cover isolation and extraction of mineral compounds, metals, metalloids, alloys and elements from waste streams, mineral ores, recyclable commodities, industrial by-products and mixed substances, the holding company is now named Core Refining Limited (CRL) and the intellectual property company is Core Intelligence Australia Pty Ltd (CIAL) which holds the Patent Application No. 2019904311 and the global exclusive licences to ABx and ALCORE continue in force.

CRL's CORE process technology involves the refining of a wide range of ore types using a combination of fluorine acids and related thermal energy process steps. The technology that is licensed to ABx and ALCORE by CRL is part of CRL's broader Core technology.

8.6 Total available funding (item 8.4 + item 8.5)	5,851
<ul style="list-style-type: none"> • ABX completed share purchase plan to raise \$0.61M in Jan 2024 	
8.7 Estimated quarters of funding available (item 8.6 divided by item 8.3)	6
<i>Note: if the entity has reported positive relevant outgoings (ie a net cash inflow) in item 8.3, answer item 8.7 as "N/A". Otherwise, a figure for the estimated quarters of funding available must be included in item 8.7.</i>	
8.8 If item 8.7 is less than 2 quarters, please provide answers to the following questions:	
8.8.1 Does the entity expect that it will continue to have the current level of net operating cash flows for the time being and, if not, why not?	
Answer: N/A	
8.8.2 Has the entity taken any steps, or does it propose to take any steps, to raise further cash to fund its operations and, if so, what are those steps and how likely does it believe that they will be successful?	
Answer: N/A	

Mining exploration entity or oil and gas exploration entity quarterly cash flow report

8.8.3 Does the entity expect to be able to continue its operations and to meet its business objectives and, if so, on what basis?

Answer:

N/A

Note: where item 8.7 is less than 2 quarters, all of questions 8.8.1, 8.8.2 and 8.8.3 above must be answered.

Compliance statement

- 1 This statement has been prepared in accordance with accounting standards and policies which comply with Listing Rule 19.11A.
- 2 This statement gives a true and fair view of the matters disclosed.

Date:23 January 2024.....

Authorised by:Mark Cooksey, CEO.....
(Name of body or officer authorising release – see note 4)

Notes

1. This quarterly cash flow report and the accompanying activity report provide a basis for informing the market about the entity's activities for the past quarter, how they have been financed and the effect this has had on its cash position. An entity that wishes to disclose additional information over and above the minimum required under the Listing Rules is encouraged to do so.
2. If this quarterly cash flow report has been prepared in accordance with Australian Accounting Standards, the definitions in, and provisions of, *AASB 6: Exploration for and Evaluation of Mineral Resources* and *AASB 107: Statement of Cash Flows* apply to this report. If this quarterly cash flow report has been prepared in accordance with other accounting standards agreed by ASX pursuant to Listing Rule 19.11A, the corresponding equivalent standards apply to this report.
3. Dividends received may be classified either as cash flows from operating activities or cash flows from investing activities, depending on the accounting policy of the entity.
4. If this report has been authorised for release to the market by your board of directors, you can insert here: "By the board". If it has been authorised for release to the market by a committee of your board of directors, you can insert here: "By the [name of board committee – eg Audit and Risk Committee]". If it has been authorised for release to the market by a disclosure committee, you can insert here: "By the Disclosure Committee".
5. If this report has been authorised for release to the market by your board of directors and you wish to hold yourself out as complying with recommendation 4.2 of the ASX Corporate Governance Council's *Corporate Governance Principles and Recommendations*, the board should have received a declaration from its CEO and CFO that, in their opinion, the financial records of the entity have been properly maintained, that this report complies with the appropriate accounting standards and gives a true and fair view of the cash flows of the entity, and that their opinion has been formed on the basis of a sound system of risk management and internal control which is operating effectively.
