ASX RELEASE

AMPLIA RECEIVES R&D TAX REBATE TOTALLING \$3.77 MILLION

Melbourne, Australia: Amplia Therapeutics Limited (ASX: ATX), (“Amplia” or the “Company”) is pleased to advise that it has received A\$3,771,706 via the Research and Development Tax Incentive from the Australian Tax Office for the financial year ended 31 March 2025.

The Australian Government's Research and Development Tax Incentive is a program to encourage businesses to undertake research and development (R&D) activities and provides eligible companies with a tax offset of 43.5%-48.5% (refundable) for eligible expenditure on R&D activities.

The refund relates to expenditure incurred in R&D activities associated with the Company's FAK inhibitors, narmafotinib (AMP945) and AMP886. These activities primarily related to the Company's ongoing Phase 1b/2a clinical trials of narmafotinib in advanced pancreatic cancer patients.

The funds will contribute to the further progression of both the ACCENT and AMPLICITY clinical trials of narmafotinib along with additional supporting R&D activities.

This ASX announcement was approved and authorised for release by the CEO of Amplia Therapeutics.

About Amplia Therapeutics Limited

Amplia Therapeutics Limited is an Australian pharmaceutical company advancing a pipeline of Focal Adhesion Kinase (FAK) inhibitors for cancer and fibrosis. FAK is an increasingly important target in the field of cancer and Amplia has a particular development focus in fibrotic cancers such as pancreatic and ovarian cancer. FAK also plays a significant role in a number of chronic diseases, such as idiopathic pulmonary fibrosis (IPF). For more information visit www.ampliatx.com and follow Amplia on [X](#) (@ampliatx) and [LinkedIn](#).

About Narmafotinib

Narmafotinib (AMP945) is the company's best-in-class inhibitor of the protein FAK, a protein over-expressed in pancreatic cancer and a drug target gaining increasing attention for its role in solid tumours. The drug, which is a highly potent and selective inhibitor of FAK, has shown promising data in a range of preclinical cancer studies. Narmafotinib is currently undergoing a clinical trial (the [ACCENT](#) trial) where it is dosed in combination with the chemotherapies gemcitabine and Abraxane in first-line patients with advanced pancreatic cancer. The trial has already achieved its desired outcome in achieving a response rate of 33%, superior to chemotherapy alone, and an interim PFS of 7.6 months has been reported. A second trial – [AMPLICITY](#) – has recently opened and is being run under an IND at sites in Australia and the US, investigating the combination of narmafotinib with the chemotherapy FOLFIRINOX in advanced pancreatic cancer patients.
